CONTENTS

This CD-ROM consists of colposcopic photographs with some histology and cytology added together with pertinent clinical information needed to make the correct colposcopic diagnosis. This exercise requires a basic knowledge of colposcopic patterns in squamous and glandular diseases of cervix, vagina, vulva and adjacent areas. The cases will test the ability to differentiate between diseases and their colposcopic mimics.

These colposcopic photographs are from the author's clinical practice in colposcopy and gynecologic oncology. Over several decades he has evaluated more than 25,000 new patients referred because of abnormal cytology or other lower genital tract pathology. All diagnoses have been histologically confirmed.
